THIS PROJECT HAS RECEIVED FUNDING FROM THE EUROPEAN UNION'S HORIZON EUROPE RESEARCH AND INNOVATION PROGRAMME – PROJECT 101058541 – DIGICHECKS

ATLAS LIVING LAB

The Atlas Living Lab is our newest and most sophisticated living lab, in which 10 years of experience with living labs accumulated in a flexible infrastructure and accompanying processes to conduct ground breaking research while respecting the privacy and comfort of the residents.

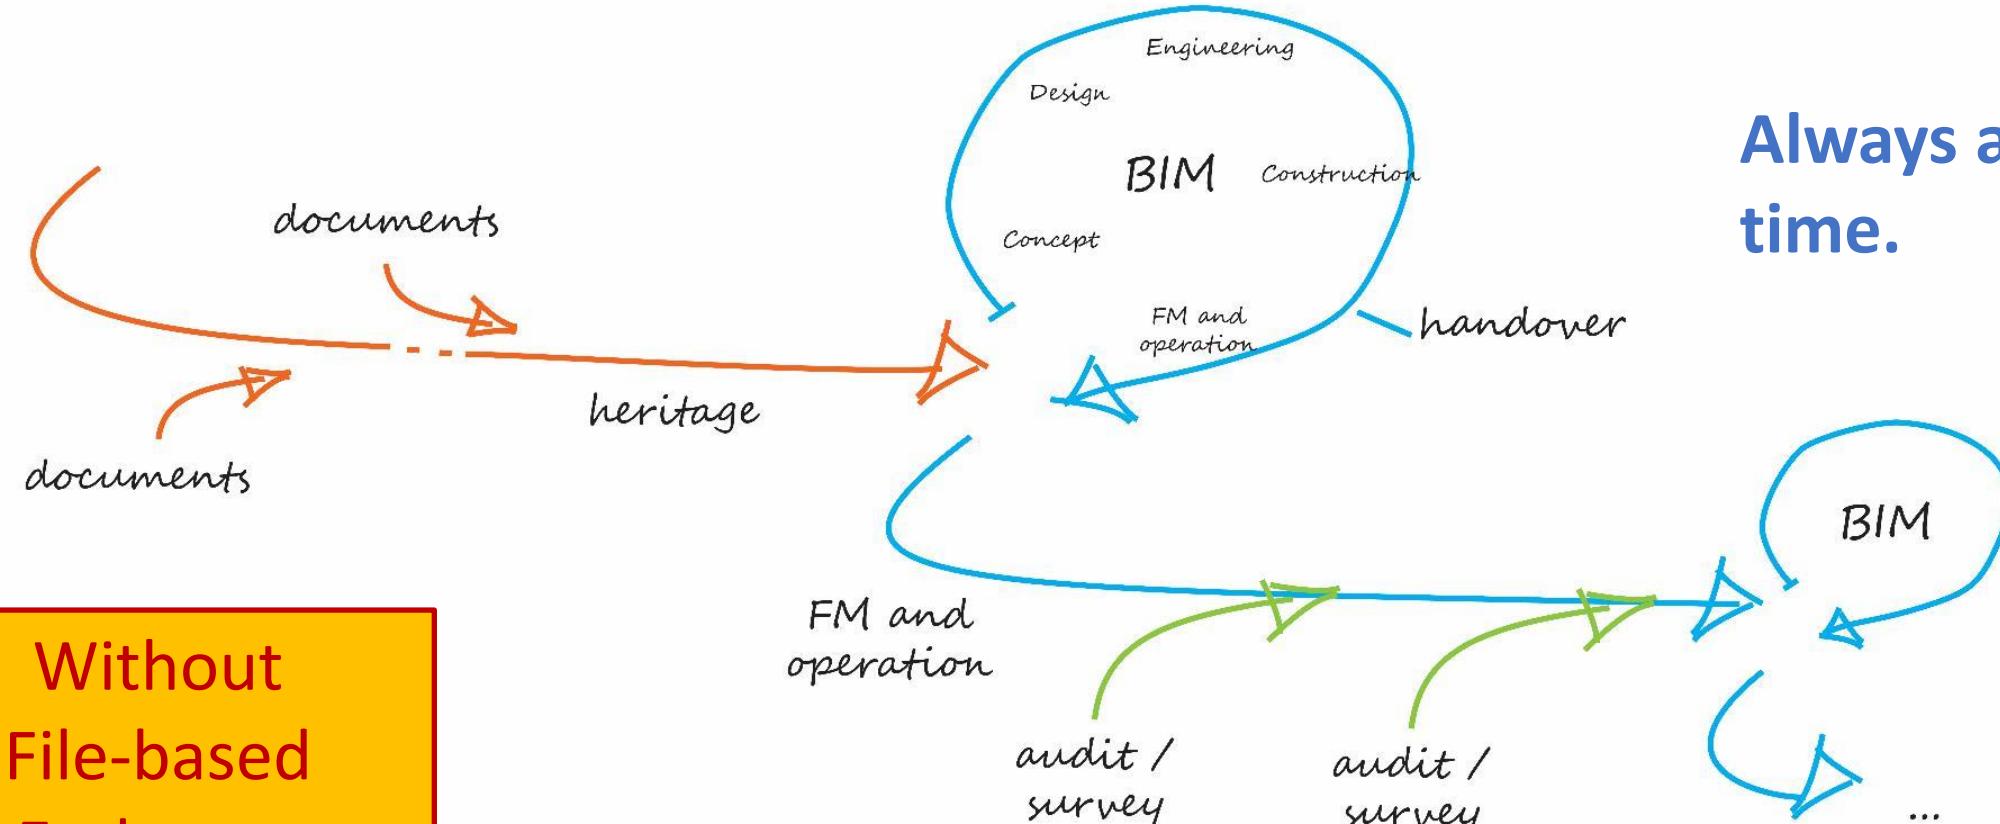

What brings
the future?

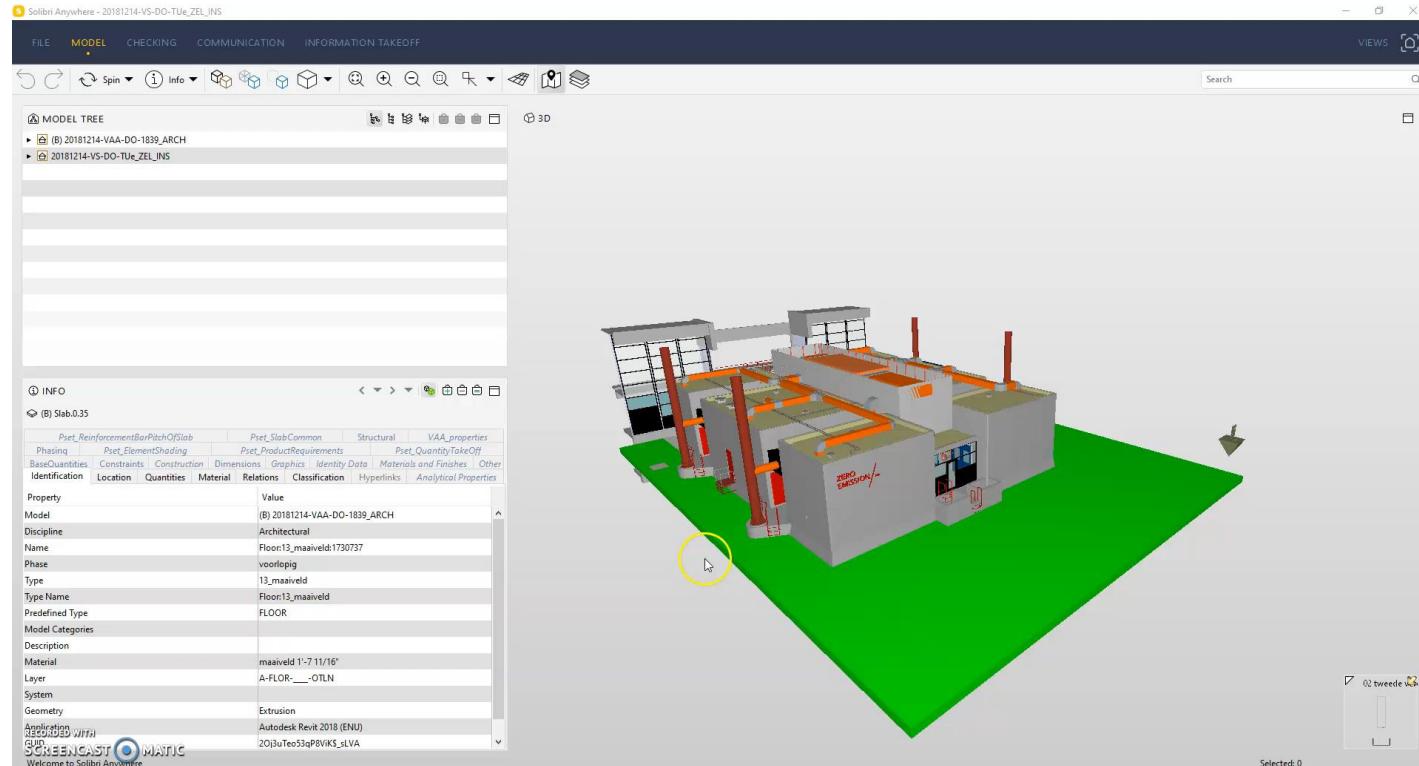

B4B: Brains for Building's Energy Systems

Content from tue-lighthouse.nl

Not only now....

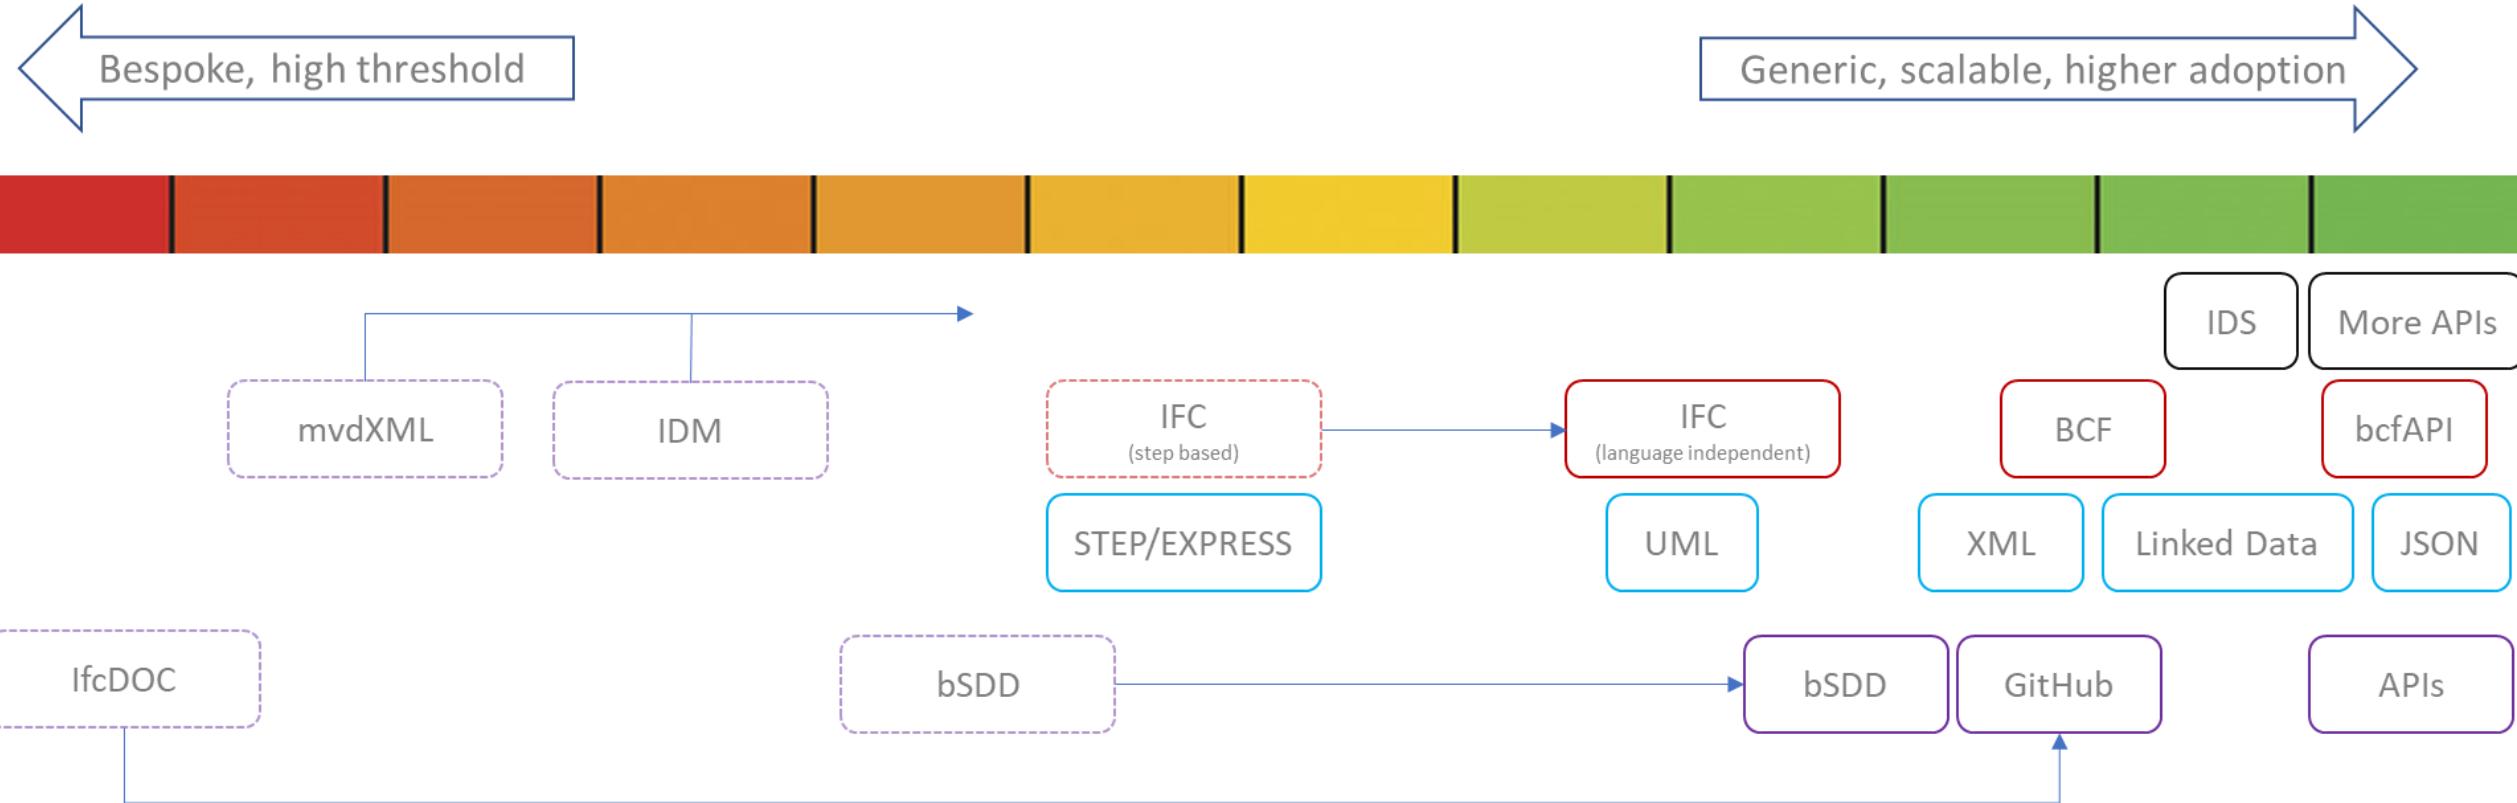

Building Information Model (BIM)
3D representation enriched with semantic information

Digital Twin (DT)
Digital counterpart for a physically existing object

Linked Building Data (LBD)
Set of interlinked web-based data about the built environment

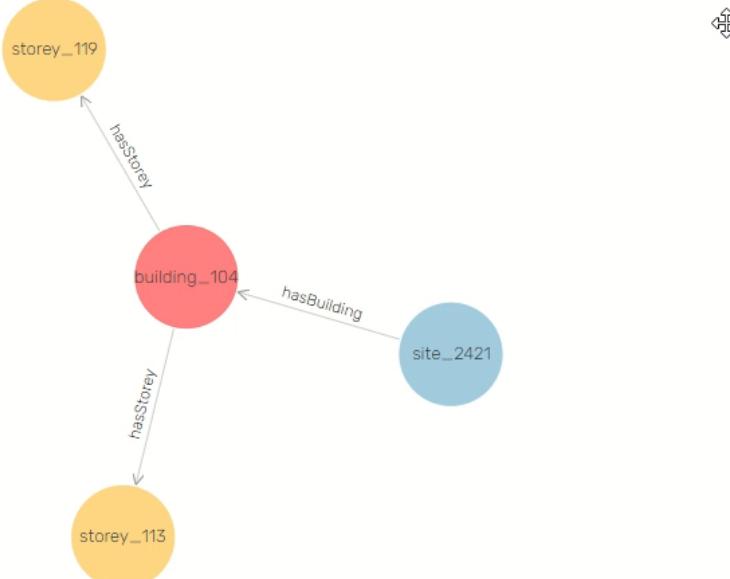

<https://www.buildingsmart.org/about/technical-roadmap/>

Object models as semantic graphs (RDF)

Data Sharing and Live Data Access

Modular data in dedicated repositories with live query access

A Cloud of Live
Building Data

Range of data available

Categories of data?

- **Data streams:**
 - Ordered lists of values, typically floating point values
 - Large amount of data -> data lakes
 - Almost no semantics, at best a few labels for categorization
 - E.g. temperature measurements, system logs (e.g. triggering of actuators), etc.
- **Semantically rich and interconnected data:**
 - Seldom including large data streams
 - Long debates about the semantics of things -> standardisation
 - Complex and brittle (breaks easily)
 - Small amount of very important data
 - Easy to combine with rule-based and/or logic-based technologies (inference and query)
 - E.g. BIM models, semantic web ontologies, taxonomies, OTLs, etc.
- **Control models:**
 - Algorithms for control, parametric functions
 - Communication system, signal processing, direct control, low latency
 - Typically located on the edge (devices with embedded functions)
 - E.g. Control Description Language (CDL), modelica models
- **User data:**
 - Outside of the system
 - Different privacy and security requirements
- **Files:**
 - No semantically rich encodings, no data streams
 - Highly valuable, and seldom machine-processable
 - E.g. PDFs, Images, Geometry ‘blobs’

Categories of data?

- Data streams:
 - Ordered lists of values, typically floating point values
 - Large amount of data -> data lakes
 - Almost no semantics, at best a few labels for categorization
 - E.g. temperature measurements, system logs (e.g. triggering of actuators), etc.
- Semantically rich and interconnected data:
 - Seldom including large data streams
 - Long debates about the semantics of things -> standardisation
 - Complex and brittle (breaks easily)
 - Small amount of very important data
 - Easy to combine with rule-based and/or logic-based technologies (inference and query)
 - E.g. BIM models, semantic web ontologies, taxonomies, OTLs, etc.

MACHINE LEARNING STATISTICAL AI METHODS

- Algorithms for control, parametric functions
- Communication system, signal processing, direct control, low latency
- Typically located on the edge (devices with embedded functions)
- E.g. Control Description Language (CDL), modelica models

User data:

- Outside of the system
- Different privacy and security requirements

Files:

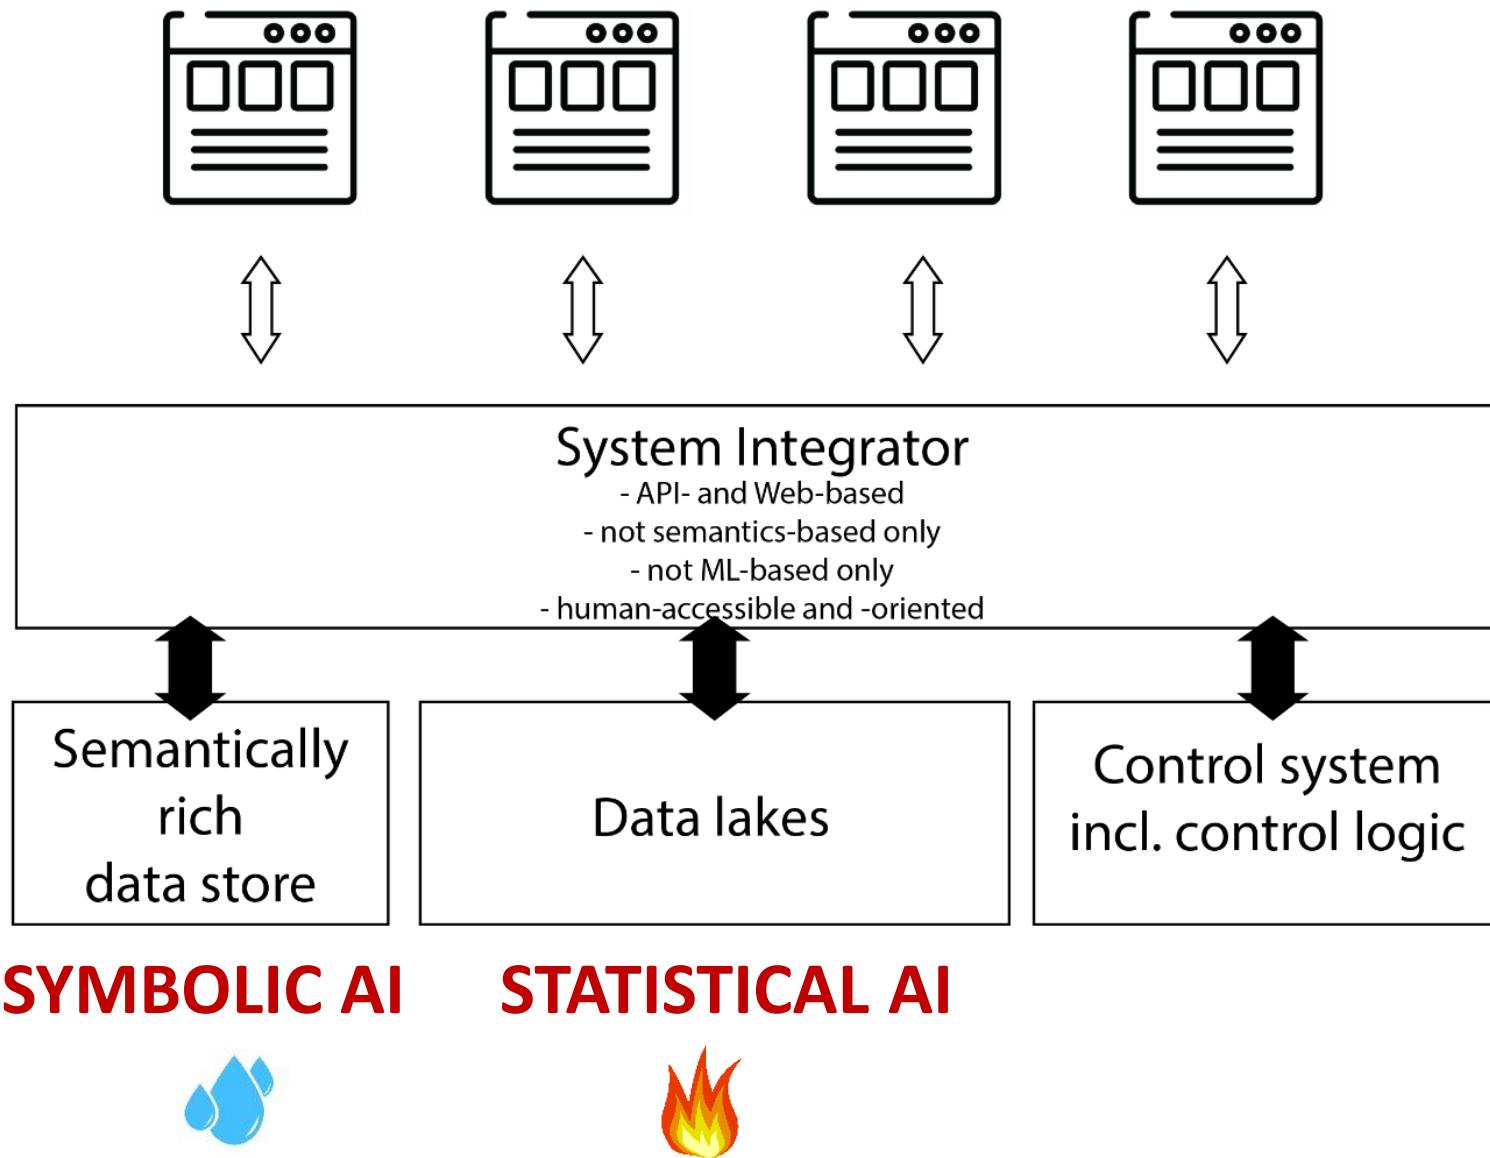

- No semantically rich e
- Highly valuable, and sensitive

SEMANTICS SYMBOLIC AI METHODS

ams
isable

Targeted framework for AI-based smart buildings

Important:

- Include access control (ACL)
- 'linking' of data on system integration level
- Agreement and standardization of labels and metadata tags
- Feed back into control systems!

Semantic graph of sensors

 - + IfcSpace
 - + IfcStair
 - + IfcStairFlight
 - + IfcWall

Can we use it
in more than 1
application?

Does it scale?

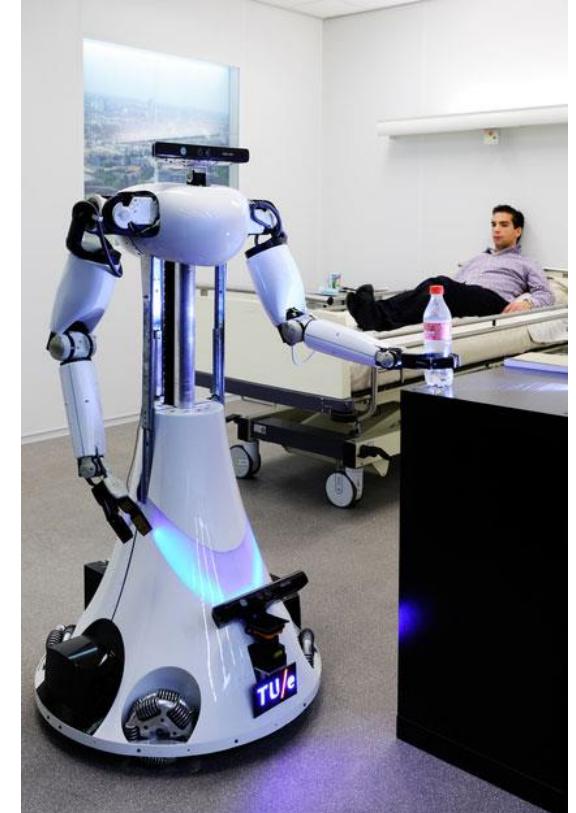

Robot navigation in buildings

Autonomous mobile robots are starting to be deployed in complex built environments where they need to navigate to complete the given tasks.

- Routing for last mile delivery (e.g. package delivery, hospital navigation)
- Emergency navigation and evacuation (e.g. fire)
- Navigation in risky environments (e.g. risk for diseases)
- Tasks in places that are difficult to reach (e.g. maintenance and inspection)

Autonomous mobile robots rely on environmental maps to do their navigation tasks:

- Topological map
- Metric map

Data Sharing and Live Data Access

Outline

Abstract

Keywords

1. Introduction

2. State of the art for robot world models and BIM

3. Method for evaluating data flows from BIM to r...

4. In-depth evaluation of data flows

5. Validation

6. Conclusion and future work

Linked Building Data incl. Geometry

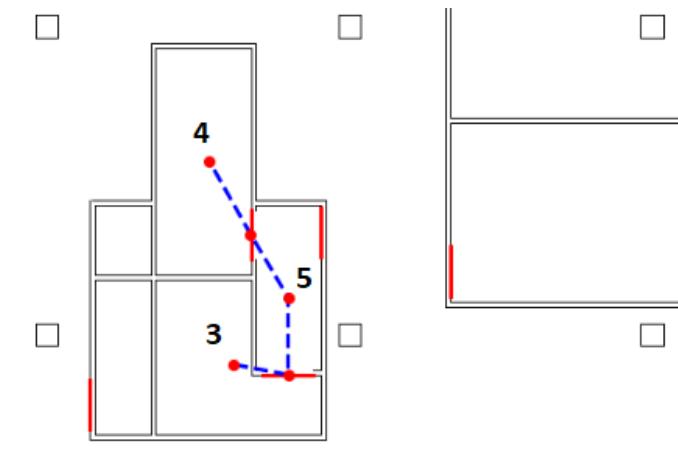

Jeroen Werbrouck et al., Scan-to-graph: Semantic enrichment of existing building geometry, Automation in Construction, 119 (2020). <https://doi.org/10.1016/j.autcon.2020.103286>.

Maps available from LBD Cloud

- A topological map abstracts metric information and represents, in a bidirectional undirected graph (unlike the RDF graphs), how spaces are connected to each other.
- A metric map includes all metric information needed for path planning

Topological map

Metric map

Conclusion

The Future is Now:

- Web-based Distributed Digital Twinning is becoming a reality
- High-quality data storage and access is possible
- Multiple interfaces to 1 Digital Twin System

So, what is in the Future?

- How well can large-scale distributed systems be maintained at scale?
- The 3D modeler challenge: how to keep geometry updated in a fast and cheap way?

BDTIC
